

Introducing enterprise search software that automatically...

- finds relevant documents in your database, without training and modeling
- highlights the information you need to know from each document
- pinpoints distributed, related concepts to reveal important context
- scores and ranks documents so users can focus on the content

...with accuracy regularly exceeding 90%

Save time and money...

- Start with the relevant data; and use the time you would normally spend building search queries and filters to generate more value.
- Eliminate the need for expensive and time-consuming data preparation.
- Generate relevant and actionable results quickly, and easily scale with continuously growing volumes of available data.

How it's done...

- entigenlogic® is focused on advancing Natural Language Processing (NLP) to the point of Natural Language Understanding (NLU).
- entigenlogic's® *Franklin™ software is unlike current NLP solutions, which rely on statistical analysis.*
- Franklin understands the fundamental structures of language, and comprehends the true meaning of words and the concepts they convey.
- entigenlogic's® Knowledge Management Approach integrates knowledge as a set of logically connected facts much as humans do.

**Knowledge isn't Power
unless you can find it.**
