

SCHAUMBURG, IL, February 28, 2022 - entigen**logic**® today announced the general availability of Franklin™ 2.4.1. This latest release introduces a number of features and enhancements which streamline Franklin's document management procedures, harmonize the Basic and Advanced User interfaces, and significantly reduces the time it takes to build a manually defined filter.

Franklin is a conceptual search engine, however unlike current technology, it does not rely on statistical correlation. It understands the concepts conveyed by words, converts them into entigen**s**®, then connects them via our patented logic rules and set-theory. Franklin can then integrate knowledge into a set of logically connected facts, much as humans do. Users can conceptually describe a search or upload an existing document that Franklin uses to auto generate search concepts. Franklin provides a Natural Language Understanding that no other approach can.

Enabling users to upload, ingest, and execute Franklin's accurate entigen**Search**™ on their personal corpora of documents has always been available to users. With Franklin 2.4.1, users can simply drag and drop documents from their local computer's file system directly into Franklin's document collections where they will automatically be uploaded and ingested with a single click. Franklin's informative User Interface provides real-time feedback on the upload and ingestion progress.

Once document ingestion is complete, whether you are a Basic User or an Advanced User, you can initiate the same simple user interface to execute Document Defined filters. If Manually defined filters are your application of choice, Franklin 2.4.1 introduces substantial reduction in filter building response time further reducing the overall time required to identify those documents that are most relevant to your filter criteria

"At entigen**logic**, we are committed to continuously improving the user experience of our unique and highly accurate conceptual search capabilities. Stay tuned for our next round of accuracy and advancements in user experience in our upcoming Franklin 2.5 release." said Andy Chu, Head of Product Development.
